In a gambling context, two players (or a gamer against the house/smart contract) wager a particular amount of cash. The winner takes the pot (minus a little platform or gambling establishment cost, known as the "rake"). While it might sound completely dependent on luck, experienced gamers understand that human behavior presents patterns, making it as much a game of mental warfare as poker or blackjack.

The Odds and Mathematics of the Game

Mathematically, a standard game of Rock Paper Scissors is a zero-sum game with simultaneous relocations. If both players play totally at random, the chances are uniformly split:

- **Probability of a Win:** 33.33%
- **Probability of a Loss:** 33.33%
- **Probability of a Draw (Tie):** 33.33%

Because ties result in a replay in the majority of gambling formats, the game mathematically neutralizes your home edge *if* played with an entirely random strategy (known in game theory as a Nash Equilibrium).

Nevertheless, people are incapable of creating truly random series. This psychological truth is where competent bettors discover their edge.
