CAUSES OF CHERRY ANGIOMA

Causes of Cherry Angioma

Cherry angiomas are a mass of dilated capillaries, the tiniest of all the blood vessels. Unfortunately, there is not enough data to determine the actual causes of cherry angioma. For the most part, they are related to aging. However, experts believe that other factors could have something to do with this skin condition.

Old Age

Experts believe that advancing age is the main contributing factor for cherry angiomas. Age contributes heavily to the formation of angiomas due to variations of the body's cells. As people age, older cells in the body tend to overgrow as they are more vulnerable to errors in the relaying of signals. Though it is rare, this can result in angiosarcoma (a form of cancer) but more often leads to the formation of a harmless bundle known as angioma. Consequently, patients may notice the first appearance of these skin lesions in their mid to late 30s.

Chemicals

Certain chemicals may contribute to the development of angioma. These chemicals include mustards gas, bromides and cyclosporine containing chemical compounds. Bromide poisoning presents a higher risk in the sprouting of cherry angioma.

Hormonal Imbalance and Other Factors

Hormonal imbalances that commonly occur during pregnancy have been linked to cherry angioma. These imbalances could also result from bromide poisoning caused by food additives and other pesticides. In the book *Fingernail and Tongue Analysis*, it is stated that angiomas occur when estrogen invades peripheral blood vessels. In other words, hormones play a role in the formation of cherry angioma.

People with unusual heart palpitations may have have cherry angioma.

Weather conditions and excessive exposure to the sun may cause angioma. UV exposure destroys cellular DNA on the outermost skin layers and also stimulates skin aging.
